

BUILDING RESILIENCE IN THE CHARLES RIVER WATERSHED

How will flooding impact **the watershed?**

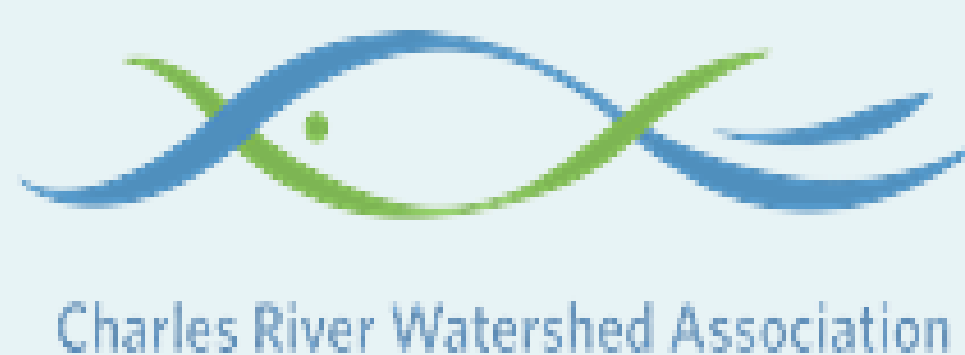

Charles River Watershed Association (CRWA) and **15 communities** in the Charles River watershed worked together to develop the Charles River Flood Model to identify areas vulnerable to flooding under future climate conditions.

This collaboration resulted in an interactive display of model results showing areas in the upper and middle Charles River watershed at risk from projected flooding events. Results also show the impact of possible flood mitigation measures.

This model will help **our region** take steps to protect the people, property and nature in the watershed. Learn more at: www.crwa.org/watershed-model.html
